ABSTRACT_ *The present study aimed to establish a training program for male and female students on the test overall capacity so as to reduce the causes of differences in male and female students the results of the test measurement center and the calendar compared to the high school the results from the viewpoint of students and find out the differences between the experimental group's performance and the performance of the control group, according to the research variables and also knowing the differences in the performance of the experimental group to test the overall capacity according to gender. To achieve the objective of the study was a training program for male and female students using brainpower both parts quantitative and verbal test design and research sample was composed of 160 students divided into two halves, male and female and each half and a control group experimental group. These results showed the existence of significant differences between the average scores of the experimental group and control group differences in telemetric the verbal part of the experimental group in the general test capabilities for boys. And the presence of statistically significant differences between each of the telemetric experimental group and telemetric control group in the quantitative part in favor of the experimental group. The presence of statistically significant differences between each of the telemetric experimental group and telemetric control group in the total score in favor of the experimental group of boys. The presence of statistically significant differences between each of the telemetric experimental group and telemetric control group in the verbal part, to the experimental group for girls. The presence of statistically significant differences between each of the telemetric experimental group and telemetric control group in the quantitative part in favor of the experimental group for girls. The presence of statistically significant differences between each of the telemetric experimental group for girls and telemetric experimental group of boys in the total score for the experimental group for girls.*
